AMENDMENT OF THE CLAIMS

1. (Currently Amended): A liquid crystal display, comprising:

a liquid crystal display panel having a liquid crystal cell at each intersection area of gate lines and data lines, which is driven by a frame divided into first and second fields and includes a display area having a specific area and a non-specific area;

an interface part outputting a first data for applying the first data to the display area during the first field;

a video processor outputting a second data to apply the second data to the specific area and a third data to apply the third data to the non-specific area during the second field ~~generating processed data to implement a brightness level at a specific area of the liquid crystal display panel that is different from a remaining area of the liquid crystal display panel~~;

a memory temporarily storing the second and third ~~processed~~ data;

a position designator designating the specific area of the liquid crystal display panel where the second ~~processed~~ data is implemented;

a timing controller realigning the first to third ~~data and the processed~~ data;

a data driver applying the first data to the display area during the first field, and applying the second data to the specific area and the third data to the non-specific area during the second field ~~supplying the realigned data and the processed data to the data lines~~; and

a gate driver supplying a scan pulse ~~to the gate lines~~,

wherein the second data is a data having different brightness from the first data and having different brightness from the third data, and the third data is a black data.

2. (Original): The liquid crystal display according to claim 1, wherein the position designator designates the specific area in accordance with a program in a computer system.

3. (Previously Presented): The liquid crystal display according to claim 1, wherein the memory temporarily stores position data for the specific area.

4. (Original): The liquid crystal display according to claim 1, wherein the video processor is comprised of a multiplexor.

5. (Currently Amended): The liquid crystal display according to claim 1, wherein a video processor generating ~~processed~~ the second data from the first data such that the brightness level of the ~~processed~~ second data is higher than brightness level of the first data.

6. (Canceled).

7. (Currently Amended): A liquid crystal display, comprising:

a liquid crystal display panel having a liquid crystal cell at each intersection area of gate lines and data lines, which is driven by a frame divided into first and second fields and includes a display area having a specific area and a non-specific area;

a computer for providing a first data and a position data for [[a]] the specific area of the liquid crystal display panel;

a video processor outputting a second data to apply the second data to the

specific area and a third data to apply the third data to the non-specific area during the second field ~~for generating processed data for the specific area from the position data and the data such that the brightness level of the processed data for the specific area is different than the brightness level of the data~~;

a memory temporarily storing the second and third ~~processed~~ data;

a timing controller realigning the first to third ~~data and the processed~~ data;

a data driver applying the first data to the display area during the first field, and applying the second data to the specific area and the third data to the non-specific area during the second field ~~supplying the realigned data and the processed data to the data lines~~; and

a gate driver supplying a scan pulse ~~to the gate lines~~,

wherein the second data is a data having different brightness from the first data and having different brightness from the third data, and the third data is a black data.

8. (Previously Presented): The liquid crystal display according to claim 7, wherein the memory temporarily stores position data for the specific area.

9. (Currently Amended): A driving method of a liquid crystal display, which is driven by a frame divided into first and second fields and includes a display area having a specific area and a non-specific area, comprising the steps of:

~~implementing a first picture for~~ applying a first data to the display data during the first field; and

~~implementing a second picture including a first area and a second area for~~ applying a second data to the specific area and applying a third data to the non-specific

area during the second field,

wherein the second data is a data having different brightness from the first data and having different brightness from the third data, and the third data is a black data ~~the second picture for the second field has a different brightness level in accordance with a type of image display than a brightness level of the first picture for the first field~~.

10. (Currently Amended): The liquid crystal display according to claim [[1]] 9, wherein the memory temporarily stores position data for the specific area.

11. (Previously Presented): The liquid crystal display according to claim 1, wherein a frame of image data stored in the memory includes at least two fields.

12. (Previously Presented): The liquid crystal display according to claim 11, wherein each of the two fields correspond to a different brightness level.

13. (Canceled).

14. (Previously Presented): The liquid crystal display according to claim 7, wherein the memory is connected between the video processor and the timing controller.

15. (Previously Presented): The liquid crystal display according to claim 7, wherein a frame of image data stored in the memory includes at least two fields.

16. (Previously Presented): The liquid crystal display according to claim 15,

wherein each of the two fields correspond to a different brightness level.

17. (Canceled).
